Contents The early 1980s saw a transition from the use of microcomputers running the CP/M operating system to the rise of the Windows platform. Microsoft's DOS was in wide use for desktop computers, with a variant known as PC DOS also available for microcomputers. To build programs for those computers, an operating system was necessary, and CP/M wasn't compatible with them, so a new operating system was needed to compete with CP/M, called MS-DOS. In 1981, Borland formed a software alliance with Microsoft to develop a "combination" operating system. The project took the form of a single application called Smart GUI, but it was not approved by Microsoft until the following year, by which time it was renamed DOS Plus and Borland itself was bought by Microsoft. By 1982, CP/M had become available on microcomputers, but it lacked a large application base, as there was no need for CAD programs for them. Microsoft therefore developed another operating system, known as MS-DOS, and CP/M became the dominant operating system for desktop computers, but without a commercially viable CAD program, commercial CAD programs were not available for microcomputers. This changed with the introduction of AutoCAD, the first major CAD program for microcomputers. From 1982, it became the standard program used for any type of drafting, although other CAD programs have since been developed for microcomputers. AutoCAD for the PC AutoCAD is available for a variety of platforms, but AutoCAD for the PC, the original version, was never commercially successful. It was eventually replaced by AutoCAD LT (Light Table), which has been the most successful CAD program for Windows. It was designed to run within the DOS Plus operating system, which provided a large set of additional capabilities that was later absorbed by Windows NT. Windows NT is no longer supported, but most CAD programs still run under Windows. All versions of AutoCAD for the PC were based on an old program called MDS-200, which had been developed at a time when users had to type their own graphics commands. After three versions of MDS-200 had been released, several ideas were implemented in the new program, including: Operator Notes - a simple way to record short statements for later editing Adjoint - allow the design to be viewed from a third dimension, and be able to swap with another design Keyboard shortcuts - make design

Programming languages In addition to the commands available in the AutoCAD drawing window, there are commands written in a number of programming languages that can be called from AutoCAD using the language's API. This includes Visual Basic, AutoLISP, Visual LISP, ObjectARX, AutoCAD C++, AutoCAD.NET, and even C#, although the latter is usually used for simple programs rather than large applications. The idea is to do something like: class Car{ int year; int speed; public: Car (int year, int speed) { this->year = year; this->speed = speed; }; }; class Lancer{ Car myCar(2005, 90); }; I'm asking because in Python, I would do something like this: class Car{ year = 2005 speed = 90 def __init__(self, year, speed): self.year = year self.speed = speed }; class Lancer{ car = Car(2005, 90) }; A: Yes, but there are two ways to do it. You could just as easily put the vector in the constructor, and you could also write a member function that takes the vector and populates it. class Car{ int year; int speed; vector ca3bfb1094
